(Received 12 May 2011)

We construct explicit rogue wave solutions, breather solitons, and rogue-bright-dark solutions for the coupled non-linear Schrödinger equations by the Darboux transformation.

PACS: 02.30.Ik, 02.30.Hq, 03.75.Nt

DOI:10.1088/0256-307X/28/11/110202

The coupled non-linear Schrödinger (CNLS/NLS) equations are a significant model in areas such as non-linear optics,^[1] bio-physics,^[2] multi-component Bose-Einstein condensates at zero temperature,^[3] finance^[4] and oceanics.^[5] However, they become integrable for a special choice of the parameter (Manakov^[6] model). On the other hand, the Manakov model has appeared in a Kerr-type approximation of photorefractive crystals. Therefore this equation can explicitly describe some physical phenomena. There is lots of the research about these kinds of system.^[7-9]

In this Letter, we consider an integrable coupled Schrödinger equation

$$iq_{1t} + q_{1xx} + 2(|q_1|^2 + |q_2|^2)q_1 = 0, \quad (1a)$$

$$iq_{2t} + q_{2xx} + 2(|q_1|^2 + |q_2|^2)q_2 = 0. \quad (1b)$$

The integrability of this system was proved by Manakov, which is here named as the integrable Manakov^[6] system. Recently, the rogue wave phenomenon was popular in nonlinear science. Rogue waves are strong wavelets that may appear in the ocean when special conditions are met. These waves can be two, three or even more times higher than the average wave crest. Rogue waves are also known as freak waves, monster waves, killer waves, giant waves or extreme waves.^[10] The first-order rational solution for the nonlinear Schrödinger equation was given by Peregrine in 1983.^[11] The rogue wave of the NLS equation was derived by Darboux transformation.^[12] Recently, we constructed some general rogue wave solutions by the Darboux-Liouville transformation.^[13] It is well known that there have been lots of results about the rogue wave for nonlinear Schrödinger equations. However, to the best of our knowledge, there are no reports on exact solutions related to the rogue wave solution of the coupled Schrödinger equation. Here we also obtain the new breather solutions and bright-dark-rogue solutions as a by-product.

The Darboux transformation^[14-17] is a powerful method to construct some interesting solutions (solitons, positons, rogue wave solution) in the integrable system.

The goal of this work is to use the Darboux transformation to construct the rogue wave solution, breathers and bright-dark-rogue solution. These special solutions may play an important role in the research of some physical phenomena such as BEC or nonlinear optics.

Firstly, we construct the rogue wave solution by the Darboux transformation. The system (1) admits the following Lax pair

$$\Phi_x = U \Phi = [i\zeta U_1 + U_0] \Phi, \quad (2a)$$

$$\Phi_t = V \Phi = [3i\zeta^2 U_1 + 3\zeta U_0 + i\sigma_3(U_{0,x} - U_0^2)] \Phi, \quad (2b)$$

where

$$U_0 = \begin{pmatrix} 0 & q_1 & q_2 \\ -q_1^* & 0 & 0 \\ -q_2^* & 0 & 0 \end{pmatrix},$$

$U_1 = \text{diag}\{-2, 1, 1\}$, $\sigma_3 = \text{diag}\{1, -1, -1\}$, and Φ is a 3×3 -matrix valued eigenfunction, ζ is a spectral parameter. The compatibility condition of the Lax pair (2) gives the CNLS (1). It is well known that the Darboux transformation^[7,15,16] for this system (2) is

$$T = \zeta I - [\zeta_1^* - (\zeta_1^* - \zeta_1)P_1], \quad P_1 = \frac{\Phi_1 \Phi_1^\dagger}{\Phi_1^\dagger \Phi_1}, \quad (3)$$

where $\Phi_1 = \Phi(x, t, \zeta_1)(m_1, m_2, m_3)^T$, m_1, m_2, m_3 are constants, I is a 3×3 identity matrix and $\Phi(x, t, \zeta_1)$ is the fundamental solution for the Lax pair equation at $\zeta = \zeta_1$, $q_i = q_i[0]$ ($i = 1, 2$). It follows the transformation between the fields,

$$\begin{aligned} q_1[1] &= q_1[0] + 6\text{Im}(\zeta_1) \frac{\phi_1 \phi_2^*}{|\phi_1|^2 + |\phi_2|^2 + |\phi_3|^2}, \\ q_2[1] &= q_2[0] + 6\text{Im}(\zeta_1) \frac{\phi_1 \phi_3^*}{|\phi_1|^2 + |\phi_2|^2 + |\phi_3|^2}, \end{aligned} \quad (4)$$

where $(\phi_1, \phi_2, \phi_3)^T = \Phi_1$.

**Email: lingliming@qq.com

We start from the seed solution-nonzero plane wave solution. We denote them as

$$q_1[0] = c_1 \exp[i\theta_1], \quad q_2[0] = c_2 \exp[i\theta_2], \quad (5)$$

where $\theta_i = d_i x + (2c_1^2 + 2c_2^2 - d_i^2)t$ with c_i and d_i ($i = 1, 2$) being arbitrary constants. However, these Lax pair equations are variable coefficient differential equations. We can not directly solve them. Luckily we can convert this system into constant coefficient differential equations by a gauge transformation. In the following, we give the transformation for the Lax pair equations (2) at $q_1 = q_1[0]$ and $q_2 = q_2[0]$. We can obtain

$$\begin{aligned} \Psi_x &= (MUM^{-1} + M_x M^{-1}) \Psi = U_1 \Psi, \\ \Psi_t &= (MVM^{-1} + M_t M^{-1}) \Psi = V_1 \Psi, \end{aligned} \quad (6)$$

where $\Psi = M\Phi$, $M = \text{diag}\{\exp[-\frac{i}{3}(\theta_1 + \theta_2)], \exp[\frac{i}{3}(2\theta_1 - \theta_2)], \exp[\frac{i}{3}(2\theta_2 - \theta_1)]\}$. Simply computing, we have

$$U_1 = \begin{pmatrix} \chi_{11} & c_1 & c_2 \\ -c_1 & \chi_{22} & 0 \\ -c_2 & 0 & \chi_{33} \end{pmatrix},$$

$$V_1 = iU_1^2 - [\frac{2}{3}(d_1 + d_2) - 2\zeta_1]U_1 + mI, \quad (7)$$

$$\chi_{11} = -2i\zeta_1 - \frac{i}{3}(d_1 + d_2),$$

$$\chi_{22} = i\zeta_1 + \frac{i}{3}(2d_1 - d_2),$$

$$\chi_{33} = i\zeta_1 + \frac{i}{3}(2d_2 - d_1),$$

where $m = 2i\zeta_1^2 + \frac{2i}{3}(c_1^2 + c_2^2) + \frac{2i}{9}(d_1^2 - d_1 d_2 + d_2^2) + \frac{2i\zeta_1}{3}(d_1 + d_2)$. In Refs. [7–9], the authors consider the solution when the characteristic equation for U_1 has a single and double root. Indeed, the characteristic equation for U_1 can possess a triple root. Our work is looking for the solution for this special assumption. Equations (6) are the constant coefficient differential equations. In order to look for the “rational solution”, we choose the parameters to satisfy $\alpha = d_2 + 3e_1$, $e_1 = \text{Re}(\zeta_1)$, $d_1 = d_2 - 2\alpha$, $c_1 = \pm 2\alpha$, $c_2 = \pm 2\alpha$, $\text{Im}(\zeta_1) = \pm\sqrt{3}\alpha$, d_2 and $\text{Re}(\zeta_1)$ are arbitrary real numbers. The matrix U_1 cannot diagonalize and can merely decompose with the Jordan form with the diagonal element. Therefore the fundamental-solution matrix for Lax pair equations (2) at $\zeta = \zeta_1$, $q_i = q_i[0]$ ($i = 1, 2$) are $\Phi(x, t; \zeta_1) = M^{-1}\Theta$,

$$\Theta = \begin{pmatrix} \varpi_{11} & 4\alpha^2\gamma + 2\sqrt{3}\alpha & 4\alpha \\ \varpi_{12} & -2\alpha^2(\sqrt{3} - i)\gamma - 2\alpha & -2\alpha^2(\sqrt{3} - i) \\ \varpi_{13} & -2\alpha^2(\sqrt{3} + i)\gamma - 2\alpha & -2\alpha^2(\sqrt{3} + i) \end{pmatrix},$$

$$\varpi_{11} = 4\alpha^2(\gamma^2 + 2it) + 4\sqrt{3}\alpha\gamma + 2,$$

$$\varpi_{12} = -2(\sqrt{3} - i)\alpha^2(\gamma^2 + 2it) - 4\alpha\gamma,$$

$$\varpi_{13} = -2(\sqrt{3} + i)\alpha^2(\gamma^2 + 2it) - 4\alpha\gamma,$$

where $\gamma = x + 2\sqrt{3}\beta it$, and $\beta = \alpha - i\sqrt{3}e_1$. In what follows, we use the Darboux transformation (4) to derive the rational solution for CNLS (1).

(1) *Rogue wave I*. Choosing the parameters $m_1 = 0$, $m_2 = 1$, $m_3 = 0$, we obtain the one rogue wave I by the formula (4)

$$\begin{aligned} q_1[1] &= \alpha \left[-1 - i\sqrt{3} \right. \\ &\quad \left. + \frac{-6\delta\alpha\sqrt{3} - 36t\alpha^2\sqrt{3} - 3 + i(36\alpha^2t + 6\delta\alpha + 5\sqrt{3})}{12\alpha^2\delta^2 + 8\delta\alpha\sqrt{3} + 144t^2\alpha^4 + 5} \right] \\ &\quad \cdot \exp[i\theta_1], \\ q_2[1] &= \alpha \left[-1 + i\sqrt{3} \right. \\ &\quad \left. + \frac{-6\delta\alpha\sqrt{3} + 36t\alpha^2\sqrt{3} - 3 + i(36\alpha^2t - 6\delta\alpha - 5\sqrt{3})}{12\alpha^2\delta^2 + 8\delta\alpha\sqrt{3} + 144\alpha^4t^2 + 5} \right] \\ &\quad \cdot \exp[i\theta_2], \end{aligned} \quad (8)$$

where $\delta = x + 6e_1t$. This kind of rogue wave solution is similar to the first-order rogue wave solution for the nonlinear Schrödinger equation.^[12]

(2) *Rogue wave II*. Choosing the parameters $m_1 = 1$, $m_2 = 0$, $m_3 = 0$, we obtain the rogue wave II by the formula

$$\begin{aligned} q_1[1] &= \alpha \left[-1 - i\sqrt{3} + \frac{G_1 + iH_1}{D} \right] \exp[i\theta_1], \\ q_2[1] &= \alpha \left[-1 + i\sqrt{3} + \frac{G_2 + iH_2}{D} \right] \exp[i\theta_2], \end{aligned} \quad (9)$$

where

$$\begin{aligned} D &= 1728\alpha^8t^4 + 288\alpha^6\delta^2t^2 + 384\sqrt{3}\alpha^5\delta t^2 + 12\alpha^4\delta^4 \\ &\quad + 432\alpha^4t^2 + 16\sqrt{3}\alpha^3\delta^3 + 24\alpha^2\delta^2 + 4\sqrt{3}\alpha\delta + 1, \\ G_1 &= -864\sqrt{3}\alpha^6t^3 - 144\sqrt{3}\alpha^5\delta t^2 - 72\sqrt{3}\alpha^4\delta^2t \\ &\quad - 216\alpha^4t^2 - 12\sqrt{3}\alpha^3\delta^3 - 144\alpha^3\delta t - 18\alpha^2\delta^2 \\ &\quad - 12\sqrt{3}\alpha^2t + 3, \\ G_2 &= +864\sqrt{3}\alpha^6t^3 - 144\sqrt{3}\alpha^5\delta t^2 + 72\sqrt{3}\alpha^4\delta^2t \\ &\quad - 216\alpha^4t^2 - 12\sqrt{3}\alpha^3\delta^3 + 144\alpha^3\delta t - 18\alpha^2\delta^2 \\ &\quad + 12\sqrt{3}\alpha^2t + 3, \\ H_1 &= +864\alpha^6t^3 + 144\alpha^5\delta t^2 + 72\alpha^4\delta^2t + 312\sqrt{3}\alpha^4t^2 \\ &\quad + 12\alpha^3\delta^3 + 96\sqrt{3}\alpha^3\delta t + 18\sqrt{3}\alpha^2\delta^2 + 108\alpha^2t \\ &\quad + 12\alpha\delta + \sqrt{3}, \\ H_2 &= +864\alpha^6t^3 - 144\alpha^5\delta t^2 + 72\alpha^4\delta^2t - 312\sqrt{3}\alpha^4t^2 \\ &\quad - 12\alpha^3\delta^3 + 96\sqrt{3}\alpha^3\delta t - 18\sqrt{3}\alpha^2\delta^2 + 108\alpha^2t \\ &\quad - 12\alpha\delta - \sqrt{3}. \end{aligned}$$

Choosing the right parameter, the pictures for $|q_1[1]|^2$ and $|q_2[2]|^2$ are shown in Fig. 1. They have different behaviors to rogue waves of NLS.^[12] Indeed we can combine the three vector solution to obtain the new rogue wave, but we cannot obtain any new kinds of

solution except the above two kinds. The rogue wave we obtained is different from Ref. [4] by a symmetry analysis, which is nothing but the rogue wave of NLS at different altitude.

Fig. 1. Different behavior of $|q_1|^2$ and $|q_2|^2$ besides the altitude for the parameters $e_1 = \frac{1}{10}$, $d_1 = 0$.

Fig. 2. (a) and (b) with parameters $c = -2$, $d = 0$, $\zeta_1 = 2i$, $\lambda_1 = 1 - \sqrt{5}$, $\tau_1 = \tau_2 = \kappa_1 = \kappa_2 = 0$; and the bright-dark-rogue solution [(c) and (d)] with parameters $c = d = 1$, $c_1 = c_2 = c_3 = 1$.

We can easily obtain the following relation for those rogue wave solutions,

$$\begin{aligned} \int_{-\infty}^{\infty} (|q_1[1]|^2 - 4\alpha^2) dx &= 0, \\ \int_{-\infty}^{\infty} (|q_2[1]|^2 - 4\alpha^2) dx &= 0. \end{aligned} \quad (10)$$

This means that $|q_1[1]|^2$ and $|q_2[1]|^2$ are equally above and below the background.

Moreover, we consider another interesting case: one is a zero solution and the other is a plane wave solution. It is interesting that we could obtain breather solutions, a bright-dark solution and a bright-dark-rogue solution by this choice. In what follows, we start from the seed solution $q_1[0] = c \exp[i\theta]$, $q_2[0] = 0$, where $\theta = dx + (2c^2 - d^2)t$. Similarly, we take

$M = \text{diag}\{1, \exp[i\theta], 1\}$. Then we can obtain the following results

$$U_1 = \begin{pmatrix} -2i\zeta_1 & c & 0 \\ -c & i\zeta_1 + id & 0 \\ 0 & 0 & i\zeta_1 \end{pmatrix},$$

$$V_1 = iU_1^2 + 2\zeta_1 U_1 + 2i(\zeta_1^2 + c^2) - \text{diag}\{0, 0, 2ic^2\}.$$

The characteristic equation for U_1 is $(\lambda - i\zeta_1)[(\lambda + 2i\zeta_1)(\lambda - i\zeta_1 - id) + c^2] = 0$. Then we would classify the characteristic equation into two kinds that different solution behaviors will exhibit.

Case I: single root. Assume that the characteristic equation of matrix U_1 has three distinct roots. Denote them as $i\zeta_1$, $\lambda_1 = \frac{i}{2}[-\zeta_1 + d + \sqrt{9\zeta_1^2 + 6\zeta_1 d + d^2 + 4c^2}]$, $\lambda_2 = i(d - \zeta_1) - \lambda_1$. Finally, we obtain the fundamental solution for the Lax pair equations $\Phi(x, t; \zeta_1) = M^{-1}Q\Omega$,

$$Q = \begin{pmatrix} 0 & c & \lambda_1 + 2i\zeta_1 \\ 0 & \lambda_1 + 2i\zeta_1 & c \\ 1 & 0 & 0 \end{pmatrix},$$

$$\Omega = \begin{pmatrix} e^{i\zeta_1 x + 3i\zeta_1^2 t} & 0 & 0 \\ 0 & \kappa_{22} & 0 \\ 0 & 0 & \kappa_{33} \end{pmatrix},$$

$$\kappa_{22} = \exp\{\lambda_1 x + [i\lambda_1^2 + 2\zeta_1 \lambda_1 + 2i(\zeta_1^2 + c^2)]t\},$$

$$\kappa_{33} = \exp\{\lambda_2 x + [i\lambda_2^2 + 2\zeta_1 \lambda_2 + 2i(\zeta_1^2 + c^2)]t\}.$$

Substituting the solution to the formula (4) and taking the parameters $m_1 = 1$, $m_2 = e^{\tau_1 + i\kappa_1}$, $m_3 = e^{\tau_2 + i\kappa_2}$, (τ_i , κ_i ($i = 1, 2$) are real numbers), we could obtain the breather solutions for the CNLS equation. This kind of solution is a periodic function or a quasi-periodic function. Taking the proper parameters, then Figs. 2(a) and 2(b) exhibit the dynamical behavior of the solutions $q_1[1]$ and $q_2[1]$. When $\text{Re}(\zeta_1) = \text{Im}(\lambda_1) = d = 0$, the solution is a time periodic function and the period is $2\pi/|d^2 - \text{Im}(\zeta_1)^2|$.

Case II: multiple roots. Assuming $\zeta_1 = -\frac{1}{3}(d + 2ic)$, the characteristic equation for U_1 has a double root. It follows that the fundamental solution for the Lax pair equations at $\zeta_1 = -\frac{1}{3}(d + 2ic)$ is $\Phi(x, t; \zeta_1) = M^{-1}Q\Omega$,

$$Q = \begin{pmatrix} 0 & -c & 1 \\ 0 & -c & 0 \\ 1 & 0 & 0 \end{pmatrix},$$

$$\Omega = \begin{pmatrix} 0 & 0 & \exp(\eta_1) \\ \exp(\eta_2) & [x - 2(d + ic)t] \exp(\eta_2) & 0 \\ 0 & \exp(\eta_2) & 0 \end{pmatrix},$$

$$\eta_1 = \frac{1}{3}(2c - id)x + \frac{1}{3}[-4cd + i(d^2 - 4c^2)]t,$$

$$\eta_2 = \frac{1}{3}(-c + 2id)x + \frac{1}{3}[2cd + i(5c^2 - 2d^2)]t.$$

Substituting the solution into the formula (4), we could obtain the bright-dark soliton and bright-dark-rogue solution. If we choose the parameter $c_3 = 0$,

it follows that $q_1[1]$ is the rogue wave solution for the NLS equation and $q_2[1] = 0$. In the following, we consider the other two non-trivial cases.

Case 1: Taking the parameters $m_1 = 1$, $m_2 = 0$, $m_3 = a_3 + b_3i$, we obtain the dark-bright solitons,

$$\begin{aligned} q_1[1] &= c \tanh\left(\frac{3}{2}\eta_{1r} + \mu\right) \exp(i\theta), \\ q_2[1] &= -4c^2(a_3 + ib_3) \operatorname{sech}\left(\frac{3}{2}\eta_{1r} + \mu\right) \\ &\quad \cdot \exp[i(dx + (3c^2 - d^2)t)], \end{aligned}$$

where $\eta_{1r} = \frac{2c}{3}(x - 2dt)$ and $\mu = \frac{1}{2} \ln\left(\frac{a_3^2 + b_3^2}{2c^2}\right)$. It is interesting that we can obtain the bright-dark soliton solution in the focusing behavior and anomalous dispersion fibers.

Case 2: Taking parameters $m_1 = a_1 + b_1i$, $m_2 = 1$, $m_3 = a_3 + b_3i$, we have

$$\begin{aligned} q_1[1] &= c \left\{ 1 - 4[\alpha_1^2 + \alpha_2^2 - \alpha_1 + i\alpha_2] \exp(-\eta_{1r}) \right. \\ &\quad \cdot \left\{ [2(\alpha_1^2 + \alpha_2^2) - 2\alpha_1 + 1] \exp(-\eta_{1r}) \right. \\ &\quad \left. \left. + (a_3^2 + b_3^2) \exp(2\eta_{1r}) \right\}^{-1} \right\} \exp(i\theta), \\ q_2[1] &= -4c[a_3(\alpha_1 - 1) - b_3\alpha_2 + i[a_3\alpha_2 + b_3(\alpha_1 - 1)]] \\ &\quad \cdot \exp\left[\frac{1}{2}\eta_{1r} + i(dx + (3c^2 - d^2)t)\right] \\ &\quad \cdot \left\{ [2(\alpha_1^2 + \alpha_2^2) - 2\alpha_1 + 1] \exp(-\eta_{1r}) \right. \\ &\quad \left. \left. + (a_3^2 + b_3^2) \exp(2\eta_{1r}) \right\}^{-1}, \end{aligned}$$

where $\alpha_1 = a_1c + c(x - 2dt)$, $\alpha_2 = b_1c - 2c^2t$. We plot the picture for this kind of solution by choosing the

right parameters (Figs. 2(c) and 2(d)). This kind of solution behaves like the nonlinear superposition for the rogue wave solution and bright-dark soliton solution.

- 112901 **Development of Vertical Buffered Electropolishing for Its Post-Treatment Technology on 1.5 GHz Niobium SRF Cavities**
JIN Song, A. T. Wu, LU Xiang-Yang, R. A. Rimmer, LIN Lin, ZHAO Kui

ATOMIC AND MOLECULAR PHYSICS

- 113101 **Reagent Vibration Effect on the Stereodynamics for the $\text{C}+\text{CD}\rightarrow\text{C}_2+\text{D}$ Reaction**
XIE Ting-Xian, SHI Ying
- 113102 **Density Functional Theory and Grand Canonical Monte Carlo Simulations of the Hydrogen Storage Properties of Partially Truncated and Open Cage C_{60} Fullerenes**
LI Xiao-Dong, TANG Yong-Jian, CHENG Xin-Lu, ZHANG Hong

FUNDAMENTAL AREAS OF PHENOMENOLOGY(INCLUDING APPLICATIONS)

- 114201 **Output Enhancement of a THz Wave Based on a Surface-Emitted THz-Wave Parametric Oscillator**
LI Zhong-Yang, YAO Jian-Quan, XU De-Gang, BING Pi-Bin, ZHONG Kai
- 114202 **A [111]-Cut Si Hemisphere Two-Photon Response Photodetector**
LIU Xiu-Huan, CHEN Zhan-Guo, JIA Gang, WANG Hai-Yan, GAO Yan-Jun, LI Yi
- 114203 **Passively Mode-Locked Fiber Laser with a Sub-Megahertz Repetition Rate**
CHEN Jiong, JIA Dong-Fang, WU Yong-Chao, WANG Chang-Le, WANG Zhao-Ying, YANG Tian-Xin
- 114204 **Bandgaps of the Chalcogenide Glass Hollow-Core Photonic Crystal Fiber**
LI Shu-Guang, ZHOU Hong-Song, YIN Guo-Bing
- 114205 **Helium-Implanted Optical Planar Waveguides in Nd^{3+} -Doped Phosphate Glass**
LIU Chun-Xiao, LIU Tao, LIU Xiu-Hong, WEI Wei, PENG Bo
- 114206 **Compact All-Fiber 102 W Picosecond MOPA Laser with a Narrow Spectral Linewidth**
WU Wen-Di, REN Ting-Qi, ZHOU Jun, DU Song-Tao, GU Xi-Jia, LOU Qi-Hong

- 114207 An InP-Based Dual-Depletion-Region Electroabsorption Modulator with Low Capacitance and Predicted High Bandwidth**
SHAO Yong-Bo, ZHAO Ling-Juan, YU Hong-Yan, QIU Ji-Fang, QIU Ying-Ping, PAN Jiao-Qing, WANG Bao-Jun, ZHU Hong-Liang, WANG Wei
- 114208 Diode Laser Optically Injected by Resonance of a Monolithic Cavity**
PENG Yu, ZHAO Yang, LI Ye, YANG Tao, CAO Jian-Ping, FANG Zhan-Jun, ZANG Er-Jun
- 114209 Automatic Compensation of Total Phase Aberrations in Digital Holographic Biological Imaging**
ZHANG Yi-Zhuo, WANG Da-Yong, WANG Yun-Xin, TAO Shi-Quan
- 114210 Novel Propagation Properties of Total Internal Reflection Photonic Crystal Fibres with Rhombic Air Holes**
YAN Hai-Feng, YU Zhong-Yuan, LIU Yu-Min, TIAN Hong-Da, HAN Li-Hong
- 114211 Single and Multicasting Inverted-Wavelength Conversion at 80 Gb/s Based on a Single Semiconductor Optical Amplifier**
HUANG Xi, QIN Cui, YU Yu, ZHANG Xin-Liang
- 114212 Multicolor InAs/InP(100) Quantum Dot Laser**
LI Shi-Guo, GONG Qian, CAO Chun-Fang, WANG Xin-Zhong, WANG Rui-Chun, YUE Li, LIU Qing-Bo, WANG Hai-Long
- 114301 Resonance Effects of Bilayered Piezoelectric Films Used for Bulk Acoustic Wave Sensors**
ZHANG Hui, ZHANG Shu-Yi, FAN Li
- 114302 Data-Derived Estimation of Source Depth Using Vertical Line Array Data in Shallow Water**
WANG Hao-Zhong, WANG Ning, GAO Da-Zhi
- 114303 Analytical Solution of the Blast Wave Problem in a Non-Ideal Gas**
L. P. Singh, S. D. Ram, D. B. Singh
- 114701 Effects of a Premixed Layer on the Richtmyer–Meshkov Instability**
TIAN Bao-Lin, ZHANG Xin-Ting, QI Jin, WANG Shuang-Hu
- 114702 Viscous Swirling Flow over a Stretching Cylinder**
Tiegang FANG, Shanshan YAO

PHYSICS OF GASES, PLASMAS, AND ELECTRIC DISCHARGES

- 115201 Observation of Hot Electrons in Surface-Wave Plasmas Excited by Surface Plasmon Polaritons**
HU Ye-Lin, CHEN Zhao-Quan, LIU Ming-Hai, HONG Ling-Li, LI Ping, ZHENG Xiao-Liang, XIA Guang-Qing, HU Xi-Wei
- 115202 Electric Discharge in Pin-Plate Audio Frequency Plasma**
A. A. Azooz, S. K. Talal

CONDENSED MATTER: STRUCTURE, MECHANICAL AND THERMAL PROPERTIES

- 116101 Optical Limiting Properties of Ag-Cu Metal Alloy Nanoparticles Analysis by using MATLAB**
WANG Yu-Hua, LI Hui-Qing, LU Jian-Duo, WANG Ru-Wu
- 116102 Formation Mechanism of Micropores on the Surface of Pure Aluminum Induced by High-Current Pulsed Electron Beam Irradiation**
ZOU Yang, CAI Jie, WAN Ming-Zhen, LV Peng, GUAN Qing-Feng
- 116103 Structural and Magnetic Studies of $\text{Zn}_{0.95}\text{Co}_{0.05}\text{O}$ and $\text{Zn}_{0.90}\text{Co}_{0.05}\text{Al}_{0.05}\text{O}$**
Murtaza Saleem, Saadat A. Siddiqi, Shahid Atiq, M. Sabieh Anwar
- 116104 Effects of the Cooling Rate on the Plasticity of $\text{Pd}_{40.5}\text{Ni}_{40.5}\text{P}_{19}$ Bulk Metallic Glasses**
LI Yang, QIU Sheng-Bao, SHAO Yang, YAO Ke-Fu

- 116201 Stiction of a Nano-Beam with Surface Effect**
LIU Jian-Lin, XIA Re, ZHOU Yue-Ting
- 116801 Hydrogen Storage Materials Based on Single-Layer Aluminum Nitride Nanostructures**
WANG Yu-Sheng, YUAN Peng-Fei, LI Meng, SUN Qiang, JIA Yu
- 116802 Effect of Interface Bond Type on the Structure of InAs/GaSb Superlattices Grown by Metalorganic Chemical Vapor Deposition**
LI Li-Gong, LIU Shu-Man, LUO Shuai, YANG Tao, WANG Li-Jun, LIU Feng-Qi, YE Xiao-Ling, XU Bo, WANG Zhan-Guo
- 116803 Simulation and Suppression of the Gas Phase Pre-reaction in Metal-Organic Chemical Vapor Deposition of ZnO**
ZHU Guang-Yao, GU Shu-Lin, ZHU Shun-Ming, TANG Kun, YE Jian-Dong, ZHANG Rong, SHI Yi, ZHENG You-Dou
- 116804 Geometric and Electronic Structures at the Interface between Iron Phthalocyanine and Si (110)**
JIN Dan, Ateeq ur Rehman, QIAN Hui-Qin, JIANG Li-Zhen, ZHANG Han-Jie, LI Hai-Yang, HE Pi-Mo, BAO Shi-Ning

CONDENSED MATTER: ELECTRONIC STRUCTURE, ELECTRICAL, MAGNETIC, AND OPTICAL PROPERTIES

- 117101 Optical and Electronic Properties of Wurtzite Structure $\text{Zn}_{1-x}\text{Mg}_x\text{O}$ Alloys**
BAI Li-Na, LIAN Jian-She, JIANG Qing
- 117301 Temperature-Dependent Optical Properties of InAs/GaAs Self-Assembled Quantum Dots: Spectroscopic Measurements and an Eight-Band Study**
ZHOU Xiao-Hao, CHEN Ping-Ping, CHEN Xiao-Shuang, LU Wei
- 117302 The Tunable Bandgap of AB-Stacked Bilayer Graphene on SiO_2 with H_2O Molecule Adsorption**
WANG Tao, GUO Qing, AO Zhi-Min, LIU Yan, WANG Wen-Bo, SHENG Kuang, YU Bin
- 117701 Low-Frequency Dependence of Conductivity and Dielectric Properties of Polyaniline/ ZnFe_2O_4 Nanocomposites**
G. D. Prasanna, H. S. Jayanna, Ashok R Lamani, M. L. Dinesha, C. S. Naveen, G. J. Shankaramurthy
- 117702 Numerical Simulations of Nonlinear Dynamics of Electron Cyclotron Maser with a Straight Beam**
KONG Ling-Bao, HOU Zhi-Ling
- 117801 Influence of Rapid Thermal Annealing on Carrier Dynamics in GaInNAs/GaAs Multiple Quantum Wells**
ZHOU Wei, YANG Jie, XIA Su-Jing, LI Xiang, TANG Wu
- 117802 Ultrafast Dynamics of Polythiophene with Phenyl Vinylene Branches Studied by Femtosecond Fluorescence Spectroscopy in Solution**
CHU Sai-Sai, GAO Chao, WANG Shu-Feng, GONG Qi-Huang
- 117803 Structural and Optoelectronic Properties of Cubic CsPbF_3 for Novel Applications**
G. Murtaza, Iftikhar Ahmad, M. Maqbool, H. A. Rahnamaye Aliabad, A. Afaq

CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY

- 118101 Growth of Few-Layer Graphene on Sapphire Substrates by Directly Depositing Carbon Atoms**
KANG Chao-Yang, TANG Jun, LIU Zhong-Liang, LI Li-Min, YAN Wen-Sheng, WEI Shi-Qiang, XU Peng-Shou

- 118102 **Annealing Effect of Pulsed Laser Deposited Transparent Conductive Ta-Doped Titanium Oxide Films**
WU Bin-Bin, PAN Feng-Ming, YANG Yu-E
- 118103 **Mechanical Performances of Carbonitriding Films on Cast Iron by Plasma Electrolytic Carbonitriding**
PANG Hua, ZHANG Gu-Ling, WANG Xing-Quan, LV Guo-Hua, CHEN Huan, YANG Si-Ze
- 118104 **Preparation and Luminescence Properties of the $\text{Na}_2\text{W}_2\text{O}_7$ Crystal**
WEI Qin-Hua, SHI Hong-Sheng, CHAI Wen-Xiang, QIN Lai-Shun, SHU Kang-Ying
- 118105 **Efficiency Droop Effect Mechanism in an InGaN/GaN Blue MQW LED**
WANG Jia-Xing, WANG Lai, HAO Zhi-Biao, LUO Yi
- 118301 **Bifurcation of a Swelling Gel with a Mechanical Load and Geometric Constraint**
XUE Feng, YONG Hua-Dong, ZHOU You-He
- 118401 **Partially Loaded Cavity Analysis by Using the 2-D FDTD Method**
YAO Bin, ZHENG Qin-Hong, PENG Jin-Hui, ZHONG Ru-Neng, XIANG Tai, XU Wan-Song
- 118501 **Improved Performance of Fluorinated Copper Phthalocyanine Thin Film Transistors Using Para-hexaphenyl as the Inducing Layer**
MA Feng, WANG Shi-Rong, LI Xiang-Gao, YAN Dong-Hang
- 118502 **High Performance Polymer Field-Effect Transistors Based on Thermally Crosslinked Poly(3-hexylthiophene)**
JIANG Chun-Xia, YANG Xiao-Yan, ZHAO Kai, WU Xiao-Ming, YANG Li-Ying, CHENG Xiao-Man, WEI Jun, YIN Shou-Gen
- 118701 **Depth Determination of an Abnormal Heat Source in Biological Tissues**
WANG Qing-Hua, LI Zhen-Hua, LAI Jian-Cheng, HE An-Zhi
- 118702 **Effects of Labeling Thiophilic FRET Dyes on the Stability and Dimerization Process of β -Lactoglobulin**
PAN Hai, XIE Jin-Bing, CAO Yi, QIN Meng, WANG Wei
- 118901 **Self-Organized Criticality in Small-World Networks Based on the Social Balance Dynamics**
MENG Qing-Kuan
- 118902 **Percolation of Mobile Individuals on Weighted Scale-Free Networks**
WU An-Cai
- 118903 **Interactions between Intersecting Pedestrian and Vehicle Flows on Roads**
GUO Ren-Yong, GUO Xi

GEOPHYSICS, ASTRONOMY, AND ASTROPHYSICS

- 119601 **Model of the Crustal Magnetic Field in the Martian Aurora Zone**
TONG Dong-Sheng, CHEN Chu-Xin
- 119801 **Modified Chaplygin Gas with Variable G and A**
Ujjal Debnath
